

## Photo Description

This picture shows an old wagon covered with thick white snow. The snow sits on top of the wagon like a fluffy blanket. You can also see snow-covered trees and bushes in the background on a sunny winter day.

## Scientific Phenomena

The Anchoring Phenomenon is snow accumulation and its interaction with different surfaces and objects. Snow forms when water vapor in clouds freezes into ice crystals, then falls to Earth and accumulates on surfaces. The snow appears thicker and more rounded on the wagon because wind patterns, surface temperature, and the wagon's shape affect how snow collects and stays in place. The evergreen trees hold more snow on their branches due to their needle structure, while bare deciduous trees show less accumulation.

## Core Science Concepts

1. States of Matter Transformation: Snow demonstrates water changing from gas (water vapor) to solid (ice crystals) through the freezing process in clouds.
2. Weather Patterns and Precipitation: Snow is a form of precipitation that occurs when atmospheric conditions include freezing temperatures and sufficient moisture.
3. Surface Interactions: Different materials and shapes collect and hold snow differently - the wagon's flat surfaces allow thick accumulation while sloped surfaces may shed snow.
4. Seasonal Changes: This scene represents winter conditions that are part of Earth's cyclical seasonal patterns caused by our planet's tilt and orbit around the sun.

### Pedagogical Tip:

Use this image to help students make connections between their everyday winter experiences and scientific concepts. Ask them to compare how snow collects on different objects in their own yards or neighborhoods.

### UDL Suggestions:

Provide multiple ways for students to engage with this content by offering hands-on snow experiments (using cotton balls or foam), digital simulations of snow formation, and opportunities to draw or act out the water cycle in winter conditions.

## Zoom In / Zoom Out

**Zoom In:** At the microscopic level, each snowflake is made of tiny ice crystals with unique six-sided patterns. These crystals form when water molecules arrange themselves in hexagonal structures as they freeze in the clouds.

Zoom Out: This snowy scene is part of Earth's larger water cycle system. The snow will eventually melt and flow into streams, rivers, and groundwater, providing fresh water for plants, animals, and humans throughout the ecosystem.

### Discussion Questions

1. What do you think will happen to this snow when spring arrives? (Bloom's: Predict | DOK: 2)
2. Why do you think the snow is piled higher on the wagon than on the tree branches? (Bloom's: Analyze | DOK: 3)
3. How might animals in this area find food and shelter during snowy weather? (Bloom's: Apply | DOK: 2)
4. What patterns do you notice about where snow collects in this picture? (Bloom's: Analyze | DOK: 2)

### Potential Student Misconceptions

1. Misconception: Snow is just frozen rain.  
Clarification: Snow forms directly from water vapor in clouds, while frozen rain (sleet) is liquid rain that freezes as it falls.
2. Misconception: All snow is the same temperature.  
Clarification: Snow can exist at different temperatures, and its texture and behavior change based on air temperature and humidity.
3. Misconception: Snow only melts when the sun shines on it.  
Clarification: Snow melts when air temperature rises above freezing (32°F), regardless of whether the sun is shining.

### NGSS Connections

Performance Expectation: 3-ESS2-1 - Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.

Disciplinary Core Ideas:

- 3-ESS2.D - Weather and Climate
- 2-PS1.A - Structure and Properties of Matter

Crosscutting Concepts:

- Patterns
- Cause and Effect

### Science Vocabulary

- \* Precipitation: Water that falls from clouds to Earth in forms like rain, snow, or sleet.
- \* Accumulation: The process of snow or other materials building up and collecting in one place.
- \* Freezing point: The temperature at which water changes from liquid to solid (32°F or 0°C).
- \* Water cycle: The continuous movement of water through Earth's atmosphere, land, and oceans.
- \* Seasonal change: Regular patterns of weather and temperature that repeat each year.
