

## Photo Description

This orange and brown mushroom is growing up from wood chips on the ground. The mushroom has a bright orange bottom part and dark brown top parts that look like fingers reaching up. Small black dots cover the orange part of this special fungus.

## Scientific Phenomena

This image shows a stinkhorn mushroom emerging from decomposing organic matter. The anchoring phenomenon is fungal reproduction and decomposition. The mushroom is the reproductive structure of a fungus that lives underground, breaking down dead plant material. The orange structure contains spores (like seeds) covered in a smelly, sticky substance that attracts flies and other insects. When insects land on it, spores stick to them and get carried to new locations, allowing the fungus to spread and continue its important job of recycling nutrients in the ecosystem.

## Core Science Concepts

1. **Living vs. Non-living Characteristics:** Fungi like mushrooms are living organisms that grow, reproduce, and respond to their environment, even though they don't move around like animals.
2. **Decomposition and Nutrient Cycling:** Fungi break down dead plant and animal matter, returning important nutrients to the soil that other plants need to grow.
3. **Interdependence in Ecosystems:** The mushroom depends on insects for spore dispersal, while insects may use it as a food source, showing how living things help each other.
4. **Life Cycles and Reproduction:** The mushroom represents one stage in the fungus's life cycle - the reproductive stage that creates spores to make new fungi.

### Pedagogical Tip:

Use the "See, Think, Wonder" thinking routine with this image. Have students first observe what they see, then share what they think is happening, and finally ask questions about what they wonder. This builds scientific thinking skills and generates authentic curiosity.

### UDL Suggestions:

Provide multiple ways for students to engage with this concept by offering hands-on exploration of different mushrooms (safe, store-bought varieties), digital microscope images of spores, and kinesthetic activities where students act out the life cycle of fungi.

### Zoom In / Zoom Out

1. Zoom In: At the microscopic level, millions of tiny spores (like microscopic seeds) are being produced inside the mushroom. These spores are so small you need a special microscope to see them, and they contain all the information needed to grow a new fungus.
2. Zoom Out: This mushroom is part of a larger forest ecosystem where fungi, plants, and animals all work together. The fungus helps keep the forest healthy by cleaning up dead leaves and wood, making the soil rich for trees and other plants to grow strong.

### Discussion Questions

1. What do you notice about where this mushroom is growing, and why might that location be important? (Bloom's: Analyze | DOK: 2)
2. How do you think this mushroom helps other living things in the forest? (Bloom's: Evaluate | DOK: 3)
3. What patterns do you see in the mushroom's shape and colors, and what purpose might they serve? (Bloom's: Analyze | DOK: 2)
4. If you were a tiny insect, what might attract you to this mushroom? (Bloom's: Apply | DOK: 2)

### Potential Student Misconceptions

1. Misconception: "Mushrooms are plants because they grow from the ground."  
Clarification: Mushrooms are fungi, which are different from plants. Unlike plants, fungi cannot make their own food from sunlight and must eat other living or dead things.
2. Misconception: "All mushrooms are bad or dangerous."  
Clarification: Many mushrooms are helpful and safe. They help break down dead things in nature and some are even good to eat, though we should never touch wild mushrooms without an adult.
3. Misconception: "The mushroom is the whole organism."  
Clarification: The mushroom we see is just the "fruit" of the fungus. Most of the fungus lives underground as tiny threads we cannot see.

### NGSS Connections

Performance Expectation: K-LS1-1 - Use observations to describe patterns of what plants and animals (including humans) need to survive.

Disciplinary Core Ideas:

- K-LS1.C - All animals need food in order to live and grow. They obtain their food from plants or from other animals.
- 2-LS4.D - There are many different kinds of living things in any area, and they exist in different places on land and in water.

Crosscutting Concepts:

- Patterns - Patterns in the natural and human designed world can be observed and used as evidence.

### Science Vocabulary

- \* Fungus: A living thing that breaks down dead plants and animals to get food

- \* Spores: Tiny parts that fungi use to make new fungi, like seeds for plants
- \* Decompose: To break down dead things into smaller pieces that help soil
- \* Reproduce: When living things make new living things like themselves
- \* Organism: Any living thing, like plants, animals, or fungi
- \* Ecosystem: All the living and non-living things in an area that work together
