

## Photo Description

This orange and brown mushroom is growing from wood chips on the ground. The mushroom has a tall stem and looks different from mushrooms we see in stores. It is a living thing that grows in nature.

## Scientific Phenomena

This image shows a stinkhorn mushroom emerging from decomposing organic matter. The anchoring phenomenon is fungal decomposition and reproduction. This mushroom is breaking down dead plant material (wood chips) and converting it into nutrients that other plants can use. The mushroom's fruiting body has emerged to release spores for reproduction, completing an essential part of nature's recycling system.

## Core Science Concepts

1. Living vs. Non-living: Mushrooms are living things that grow, need food, and reproduce
2. Life Cycles: Mushrooms start small and grow bigger, then make new mushrooms
3. Decomposition: Some living things help break down dead plants and make soil better
4. Habitats: Different living things need different places to live and grow

### Pedagogical Tip:

Use real mushrooms or detailed photos during lessons, but establish clear "look but don't touch" rules. Many young children are naturally curious about mushrooms but need to learn safety first.

### UDL Suggestions:

Provide multiple ways for students to explore this concept: tactile experiences with safe materials like play dough to model mushroom growth, visual diagrams showing before/after decomposition, and movement activities where students act out a mushroom growing from the ground.

## Zoom In / Zoom Out

1. Zoom In: Tiny invisible parts called spores are like seeds that help make new mushrooms. The mushroom sends out thin threads underground that we cannot see.
2. Zoom Out: This mushroom is part of a big system where dead plants become food for new plants. It helps keep forests and gardens healthy by cleaning up old leaves and wood.

## Discussion Questions

1. What do you notice about where this mushroom is growing? (Bloom's: Observe | DOK: 1)
2. How do you think this mushroom is different from the plants in our classroom? (Bloom's: Compare | DOK: 2)
3. Why do you think mushrooms might be important for other living things? (Bloom's: Analyze | DOK: 3)
4. What questions do you have about how mushrooms grow? (Bloom's: Create | DOK: 2)

## Potential Student Misconceptions

1. Misconception: "Mushrooms are plants because they grow from the ground."  
Clarification: Mushrooms are fungi, which are different from plants. They don't make their own food like plants do.
2. Misconception: "All mushrooms are safe to eat."  
Clarification: Many mushrooms can make people very sick. We should never eat mushrooms we find outside.
3. Misconception: "Mushrooms are bad because they grow on dead things."  
Clarification: Mushrooms help nature by cleaning up dead plants and making the soil healthy for new plants to grow.

## NGSS Connections

- Performance Expectation: K-LS1-1 - Use observations to describe patterns of what plants and animals need to survive
- Disciplinary Core Ideas: K-LS1.C - Organization for Matter and Energy Flow in Organisms
- Crosscutting Concepts: Patterns - Patterns in the natural world can be observed and used as evidence

## Science Vocabulary

- \* Mushroom: A living thing that grows from the ground and helps break down dead plants
- \* Fungus: A type of living thing that is not a plant or animal
- \* Decompose: When dead things break down into tiny pieces that help soil
- \* Spores: Tiny parts that help mushrooms make new mushrooms
- \* Habitat: The place where a living thing lives and finds what it needs
